Meeting records Transcript Recording

Summary

Proposal review debrief covered LiveLack's fan engagement ecosystem with customization options for gamification and monetization.

LiveLack Engagement Ecosystem Overview
The LiveLack proposal, detailed as an AI-powered fan engagement ecosystem, offers pre-built, web-responsive solutions like mini-games and community tools via an embeddable web view. LiveLack positions itself as a strategic partner capable of deploying solutions at scale for millions of fans across all World Cup matches.

Integration and Platform Customization
The platform requires the Opta data feed and can integrate with existing SSO or CRM systems, or LiveLack can provide these solutions if the client lacks them. The Play Predictor and knowledge-based games are flexible and customizable, with automatic game resolution handled via the Opta data feed.

Gamification and Monetization Features
LiveLack supports mass audience participation targeting over 10 million users, using Quests, leaderboards, and tiered progression to drive repeat daily interaction. Payment processing for premium leagues is technically

possible via integration with a payment gateway like Stripe, although this is not an out-of-the-box solution.

Details

- **Proposal Walkthrough and Decision Timeline**: Rodrigo Porto introduced the meeting's purpose, which was to review the proposal details, address outstanding questions, and finalize a decision by the end of the week. Alex Hay confirmed the plan and proceeded to share their screen to walk through the LiveLack proposal, which details their status as a global leader in fan engagement and monetization experiences (00:00:00).
- **LiveLack's Fan Engagement Ecosystem**: Alex Hay described LiveLack's AI-powered fan engagement ecosystem, which includes interactive widgets, mini-games (as proposed), community tools, and loyalty and rewards systems (00:01:13). They explained that LiveLack offers pre-built solutions, specifically a web view that can be embedded into the client's website, ensuring web-responsive functionality on mobile devices (00:02:09).
- **Key Partnership Strengths and Technology Framework**: LiveLack positions themself as a strategic partner, not just a vendor, highlighting their ability to deploy solutions at scale, supporting millions of fans and all World Cup matches. Their technology is modular, scalable, and tournament-ready, combining interactive features, gamification, rewards, and loyalty mechanics for activations like predictions, trivia, and leaderboards (00:03:01).
- **Integration Capabilities and Data Feeds**: The LiveLack platform can seamlessly integrate into the customer's platform via web views, being an API-first organization, and can integrate with existing Single Sign-On (SSO) or Customer Relationship Management (CRM) systems (00:03:01). Rodrigo Porto confirmed that they have a contract with Opta for the data feed, which is what LiveLack requires, and they are currently checking the internal permissions regarding passing this data on to third parties (00:05:25).
- **SSO and CRM Solutions**: Rodrigo Porto reported that the team is internally evaluating if they have an existing SSO service or CRM platform, though they do not currently believe they possess one (00:05:25). Alex Hay clarified that if the client does not have an SSO or CRM, LiveLack can provide a solution,

emphasizing that a login mechanism is important for identity resolution and saving user results and leaderboard positions (00:06:36).

- **Driving Audience Participation and Monetization**: LiveLack focuses on handling mass audience participation, targeting over 10 million users, and driving repeat daily interaction through trivia and other experiences (00:07:38). They noted that they also have the ability to offer monetization opportunities, such as selling the engagement hub as an activation to a sponsor like Heineken (00:08:42).
- **Experience Customization and Game Resolution**: Alex Hay showcased their Play Predictor experience, confirming that questions, the number of questions, and the UI are all completely flexible and customizable to align with the client's branding (00:08:42) (00:10:35). Points earned aggregate onto the leaderboard, and game resolution will be handled automatically through the Opta data feed (00:09:38).
- **Knowledge-Based Games and Scheduling**: Beyond predictions, LiveLack offers off-the-shelf knowledge-based games like trivia, a Wordle variation called "Guess the Word," and a matching game called "Guess What" (00:10:35). Rodrigo Porto suggested evaluating how to use these different games for missions, such as scheduling them on different days, and Alex Hay demonstrated the arcade Content Management System (CMS) that allows for games to be scheduled ahead of time for the entire tournament (00:11:28).
- **Social Features, Leaderboards, and Gamification**: LiveLack can integrate global leaderboards and friends leagues, and they suggested integrating influencer or celebrity challenges using specific flares or emojis next to their names (00:14:27). They also described how Quests can be used to gamify social sharing, such as rewarding users with double the amount of "lucky numbers" for sharing, which increases their chances in the weekly lottery draw (00:15:24).
- **League Tiering and Premium Access**: The platform utilizes tiered progression, moving users from first-timers to regulars through competition and social interaction, using elements like points, badges, quests, and streaks (00:18:20). They can implement global rankings, public leagues (like national leaderboards), private leagues (friends/community), and "premium leagues," which can restrict access based on user attributes, such as if they are an Amazon Prime or other premium-tier user (00:20:05).
- **Payment Processing for Premium Leagues**: Rodrigo Porto inquired about the possibility of charging users directly within the platform for access to the

premium league if no commercial sponsor is secured, noting that this is a tragic, non-preferred scenario. Alex Hay confirmed that while a payment gateway like Stripe is not out-of-the-box, it is possible as they currently power membership programs gated by payment processors, adding that they will need to determine how to authenticate a user's membership in a sponsor's ecosystem (00:28:39) (00:30:38).

- **Post-Proposal Follow-Up Actions**: Alex Hay agreed to follow up on the estimated time and cost for implementing a payment processing solution like Stripe if that scenario becomes necessary (00:31:36) (00:43:39). The commercial pricing includes support for 10 million users, which was calculated based on a per-million-user trench model (00:39:17).
- **Development Timeline and Collaboration**: LiveLack estimates an eight-week timeline, though this could be extended by potential integrations like Stripe (00:33:58). Alex Hay confirmed that the LiveLack team would develop the UX and frontend, and the client's team would validate the progress on a weekly basis (00:36:27).
- **Technical Support for End Users**: Alex Hay clarified that LiveLack does not typically deal with end customers but rather integrates into the client's SSO, which is managed by the client's team (00:41:38). LiveLack can internally monitor and remedy platform issues, such as a user not receiving points, but for end-user support (like login troubles), they recommended providing a support email (00:42:43).
- **Scheduling Next Engineering Call**: Rodrigo Porto requested an additional call with the technical person from Kazet and an engineer from LiveLack to discuss architecture and technical details (00:43:39). Alex Hay confirmed availability for an engineering call on the following day or Thursday afternoon, pending the client's scheduling confirmation (00:43:39).

Suggested next steps

- [ ] Rodrigo Porto will check with the person responsible about the Opta contract to see if they can pass the data feed on to third parties.
- [ ] Rodrigo Porto will understand internally if KSTV has an SSO service or a CRM platform.

- [ ] Alex Hay will follow up with a suggestion on how to handle the SSO and CRM if KSTV does not have those services.
- [ ] Alex Hay will provide an estimated cost and time perspective for implementing a payment partner like Stripe to charge users for the premium league.
- [ ] Rodrigo Porto will coordinate with Alex Hay to organize an engineering call with the technology person from Kazet to discuss architecture and technical details.

LiveLike proposal review - Transcript

00:00:00

Rodrigo Porto: Yes. Yeah. Okay. He just joined
Renato Drumond: Hi
Rodrigo Porto: us.
Alex Hay: Hey,
Renato Drumond: guys.
Alex Hay: Ronaldo.
Rodrigo Porto: So, Alex, um I think we want to go through the the proposal um with you,
Alex Hay: Mhm.
Rodrigo Porto: see some of those the details and the the questions we had and
Alex Hay: Mhm.
Rodrigo Porto: understand well we we want to till the end of this week u make a decision. So um we need to to clear our minds and the best way possible in each of the this the scenarios. Okay.
Alex Hay: Perfect.
Rodrigo Porto: So I think that you can uh share it with us
Alex Hay: Yep. Let me give me a second.
Rodrigo Porto: the
Alex Hay: I'm just going to bring it up on my screen. Okay, you should be able to see my screen now.
Rodrigo Porto: Yeah.
Renato Drumond: Yeah.
Rodrigo Porto: Whiskey.
Alex Hay: Great. Perfect. Um, did you want me to sort of just walk through this with you?
Rodrigo Porto: Yeah.

00:01:13

Alex Hay: Perfect. No worries. Um, so I mean the first few slides are really just a background about Livelack, uh, about the business just to give you guys some context

about, you know, obviously who we are.
Rodrigo Porto: And
Alex Hay: uh obviously as you know and Ronaldo just for your benefit because I know we haven't met on the call before uh
Rodrigo Porto: so
Alex Hay: but we are basically a global leader in fan engagement uh community and monetization experiences in sports media entertainment and broadcast. So we work right around the world with a whole heap of different organizations a few of which are detailed on the right there. We've tried to, you know, obviously mention quite a few broadcasters and media companies there given obviously who we're talking to. In terms of what we actually do broadly speaking, um, is we have a AI powered fan engagement uh, ecosystem. We have a bunch of different buckets that our products fall into. The first one is the one that we're talking to you guys about is all about engaging and incentivizing audiences and engaging them in different ways.

00:02:09

Alex Hay: So, we do that through interactive widgets. We do that through our suite of mini games which is obviously what we uh have have proposed to you guys. We do it through you know community and social tools. Uh we do it through loyalty and rewards and then we gather insights and we monetize. It's essentially sort of you know how we operate. Two ways to uh to work with us build with us or we provide you pre-built solutions. And uh the one on the right is the one that we're talking to you guys about in terms of us providing you a web view to basically be able to embed into uh your website and uh make it make sure that it is web uh responsive as well on mobile. Just a few you know faces so you know who you're talking to and and and uh who we are but I won't go through that now. and we just sort of detailed based on you know I guess our experience talking to uh your team and everything that we've discussed over the last week or two.

00:03:01

Alex Hay: Uh we just wanted to sort of I guess call out some of the key areas why we think we're a great partner for you guys. So firstly, it is uh you know obviously built for you know the KSTV ecosystem um being able to support millions of fans being able to

support all of the matches in the World Cup being able to um you know really provide the you know framework to be able to actually deploy this at scale uh and to be able to deploy it well. We have modular scalable and tournament ready technology. So, we combine our interactive features, gamification, rewards, and loyalty mechanics. So, three of those buckets, but combine them all into one to basically create one platform to unlock all of the capabilities that you guys are looking to uh have as part of your activation for the FIFA World Cup in terms of those predictions, in terms of the trivia, in terms of the leaderboards, the social elements, uh, and everything else to to basically pull this all together really well. uh we have the ability to have uh you know I guess seamless um integrate seamlessly into your into your platform and we do that through you know those web views we are an API first organization so uh we can basically integrate into your SSO into your um you know CRM if you have one uh I know that that obviously was a question that came up Rodrigo and we can talk about that but you know we can provide that as well if you don't have that uh same as the match data feeds again if you don't have that we can provide that

00:04:28

Alex Hay: as part of this as well, but essentially it is being able to connecting to all those different platforms to be able to create this really cohesive integrated program uh for obviously the World Cup. And we see ourselves as a strategic partner, not just a vendor. uh we like to come in and try and bring all of the you know um IP and uh you know intellectual property and and knowledge that we have from our 10 years of doing this to really optimize the experience for the end and the end user. So, you know, obviously your PC, Rodrigo, was fantastic. Uh, very cool. Um, loved your thinking on it. Um, and you definitely, yeah, some really great stuff there. Uh, but you know, I think we can definitely bring some some knowledge of our own, uh, to really enhance that experience once it actually gets to the end product, um, to make it as good as it possibly can be. So, just wanted to call Sorry.
Rodrigo Porto: on that. I count on that.
Alex Hay: Perfect.

00:05:25

Alex Hay: Good. Good.

Rodrigo Porto: Just think about the the CRM and SSO and the
Alex Hay: Um,
Rodrigo Porto: the data feed. I just checked and here we we we do have um contract with Opta the the data feed. So I'm just trying to understand if we can uh with the
Alex Hay: no.
Rodrigo Porto: opta contract if we can just um pass it on into third parties and and go on with that. So I'm I'm already in contact with the person responsible and about the SSO and the CRM. We're also starting to understand inside internally if if
Alex Hay: Perfect.
Rodrigo Porto: we have something like that a service like an SSO and if we have like some CRM um platform but I don't think so. I I really don't think they they have. Okay. As I said,
Alex Hay: It's okay.
Rodrigo Porto: it's they're not completely into this this this um type of of of of platforms. So
Alex Hay: Perfect. Yep. So the opt is opter is what we need.

00:06:36

Rodrigo Porto: maybe
Alex Hay: Um so opa normally sell their uh data in two two types. So either the standard or the advanced. The standard should work for this. Uh so we should just need that. Um and typically how it works is uh obviously if you know KSTV have that um you know subscription then they can pass that to us. That's how we work with all our other providers. We don't need to be party to that at all. Um because you're using it to power your your own experience in your own you know KTV ecosystem. Um so typically that's how it works. In terms of the SSO and CRM that's okay. Um if if they don't have it that's totally fine. uh just let me know and I can um come back with a suggestion on on how we handle that. But again, obviously in terms of you know identity resolution and being able to have people log back in uh have their
Rodrigo Porto: Okay.
Alex Hay: results saved, have you know their leaderboard position, all that sort of stuff, it's really important to have you know a login of sorts.

00:07:38

Alex Hay: Um but we can definitely help with that.
Rodrigo Porto: Yeah.
Alex Hay: Uh but again, you know, typically if our customers do have one of their own, we like to try and adopt that just for ease. Um but you know we're flexible so we can work through that. Uh and then you know based on again the conversations um just just calling out some of the key pieces here. So obviously the the mass audience participation. So you know having the scalability to be able to handle that uh in terms of you know having the 10 million plus users that you've called out being able to drive daily repeat interaction throughout the tournament. So not only you know throughout the games but also you know engaging people in other ways. So through the trivia through you know other experiences that we might you know roll out together. So you know being able to work with you on that. Thirdly I know this the social uh verality is huge. So being able to share you know with friends on social media or through you know WhatsApp groups or text or whatever else you know being able to do that which is obviously important and then offering monetization opportunities as well.

00:08:42

Alex Hay: So obviously if you do have 10 million users you know that potentially whether they wanted to sell that to a partner as a as an activation so the you know I don't know the Heineken uh you know engagement hub or whatever uh we do have the opportunity to do that as well. Uh so you know that's that's totally um within scope and then in terms of the experience itself. So again based on our conversation and and we didn't have time to mock anything up specifically but in terms of you know what the experience would look like and and feel like uh we have this play predictor experience which you know for Chelsea looks something like this uh in terms of being able to predict you know the game score what time the first goal is going to be um you know how many shots on target will Chelsea have again all of these questions are completely changeable adjustable we can make them whatever you want we can make them you know we have five questions, we could have three questions, we can figure that out.

00:09:38

Alex Hay: Uh we're completely open. Uh obviously um the leaderboard aggregation as well. So all of the points that are earned through this game pivoting onto the leaderboard, we can have you know different types of points allocation depending on your different types of users as well like you spoke about. Um and we can have the automatic resolution as well through Opta. So you know obviously once we get the results in from OPA in terms of you know the game result was three to two and obviously you know the people that that that guessed correctly would get points depending on you know the the sort of table of of points that we've set up in the back end in terms of um you know it's all built for high concurrency as well. Uh so you know obviously in terms of being able to manage the load that you guys have or anticipating um that is completely fine. Uh yeah, so that's sort of the first piece. Any questions on that?
Rodrigo Porto: No.
Renato Drumond: Everything's perfect.
Alex Hay: Perfect.

00:10:35

Alex Hay: And then yeah, just just for clarity as well, obviously the UI is all flexible and and we'll work with you on the UI and on how you want that. I know that you had a pretty simple um sort of formbased uh template, I guess, in your demo, Rodrigo. Uh but again, can we can work with you on on what that looks like around,
Rodrigo Porto: Yeah.
Alex Hay: you know, your branding and and all that sort of stuff.
Rodrigo Porto: Yes, please.
Alex Hay: And then in terms of the knowledgebased games, I know we spoke about trivia, but I just thought I'd put a couple of extra ones in here just to get you thinking. You know, other other types or formats that we might want to think about. All of these are are off the shelf. They're very easy, um, to deploy. They're all AIdriven. Um, so we might want to create a, you know, a trivia game which is just tied to, you know, the teams or, you know, specific players or pop culture or, you know, World Cup history, whatever we might want to do that's completely open and flexible.

00:11:28

Alex Hay: We can do that. Guess the word is is our variation of Wordle as well. So again, it's a lightweight, easy to deploy game. It's really fun. you know, you can make it World Cup uh related um and you know, obviously build streaks and quests and and all sorts of other gamification elements into this as well to really drive, you know, users back into these experiences every day. Uh and then we have guess what as well. This is essentially like a matching game. So, you know, uh what does this say? Name the players who led teams in home runs last season. So, you know, Kyle Schwartzer, Phillies, that person, Mets, you know, you can kind of like guess guessing game, testing, you know, fans knowledge as well. So, I know that we spoke specifically about trivia, but just wanted to pop these on here as food for thought. Uh, if you wanted to do something a little bit different, uh, we're totally open.
Rodrigo Porto: We can evaluate for example the missions for the missions like trivia is on Mondays, Wednesdays and Fridays and then we do something like I guess the word in other days and a guess what in other days something like that okay they are all AI um I mean there's no operational side there for Kazat.

00:12:38

Rodrigo Porto: They are all AIdriven
Alex Hay: Yep. So, what we would do uh is our team would work with either you guys or KZ TV uh to basically
Rodrigo Porto: games.
Alex Hay: set up that schedule. So, for example, let's just keep it simple. we wanted to do trivia every single day. Then what we can do is I'm just going to show you our arcade CMS. This is where you manage the trivia game. When we go into create the trivia game, we can basically go in once I go through all these steps. Let's just go, you know, um Brazil FIFA World Cup would be our questions for example. Five questions. Generate that. And then when we get down to the last step here, we can basically schedule this on a specific day and time. So what we might want to do is schedule ahead of time every single trivia game for every single day.
Rodrigo Porto: Oh
Alex Hay: And then we might allow that to be open for 24 hours and then the next one launches the next day.

00:13:32

Rodrigo Porto: yeah.
Alex Hay: And then, you know, fans can earn more points for the next day's activities and all that sort of stuff. So, um, you do have that flexibility to be able to set this up ahead of time so that, you know, before the tournament starts and when you launch, all of the games are set up and they don't have to do anything.
Rodrigo Porto: We think okay and who is responsible for
Alex Hay: Yeah.
Rodrigo Porto: for scheduling
Alex Hay: Uh, well, we can we can help you do it.
Rodrigo Porto: everything.
Alex Hay: So, the idea is that you guys or or CZ TV directly have access to that platform to be able to manage things if you would like. Uh, but our team will help set those up. uh ahead of time, especially in this example where it's, you know, it's a defined time period of of the World Cup. Um, and it would be very easy to set up, you know, I don't know, 40 or 50 days worth of activations if if that's how long it was was taking.
Rodrigo Porto: Good.

00:14:27

Alex Hay: So, yeah, we we can work with you on that. That's easy.
Rodrigo Porto: Okay.
Alex Hay: And then this slide just talks to, I guess, how we're, you know, turning the gameplay into a global event. So, you know, obviously integrating all of the different uh leaderboards, both global leaderboards, but also, you know, friends leagues as well. So, you can kind of see there we've got, you know, in this example in screenshot, we've got a global and national and a friends. For you guys, it just might be a global and a friends league. Um, and we can also have, you know, influencer and creator challenges as well. So, you know, we can have different um what we call flares or little emojis next to, you know, your influencers, which might be, you know, celebrities or past players or commentators or, you know,
Rodrigo Porto: Yeah.
Alex Hay: pundits or whatever. Um to basically call out who those people are as well and and they can obviously be on the leaderboard and or we might even be able to set up a specific leaderboard that everyone can see um just them.

00:15:24

Alex Hay: Uh and then
Rodrigo Porto: celebrities. We have to do a celebrity. Yeah.
Alex Hay: Does that include you,
Rodrigo Porto: No
Alex Hay: Roger?
Renato Drumond: Not yet. Not yet.
Rodrigo Porto: way.
Alex Hay: Um, and then, uh, yeah, we've also got, you know, I just put this in here for the quest example as well, so you can kind of see, I'll try and make this full screen here. Hang on, let's move you down here. You can kind of see here that you've got the, you know, Sharon wins. So, you know, post on X, post on Tik Tok, post on Instagram. So, you know, we can just create these quests and those quests can be anything. The quests could be play five days in a row and earn 100 extra points or, you know, share these two um and win 350 points. Again, we can sort of gamify all this and and we're flexible on how we can sort of bring this together. And that's how we really drive our fans to do this social sharing piece, which I know is going to be, you know,

00:16:16

Rodrigo Porto: Okay.
Alex Hay: important for you guys. So in terms of the thinking around that and how we can bring some of our knowledge and and what what's worked with other clients, this is an example of that. Um because it really sort of gamifies, you know, and and gives people reasons for actually sharing these activations.
Rodrigo Porto: Is it possible for example instead of uh winning like 100 extra points. Is it possible that he can duplicate dup duplicate the amount of lucky numbers he got by answering a a trivia question?
Alex Hay: Uh, as in like so if they do this quest and they get like three times points in the trivia that
Rodrigo Porto: Yeah. for example,
Alex Hay: day.
Rodrigo Porto: because the the the the main point for uh of the trivia is that you're going

to answer the the the question and then you're going going to you're not going to win points or nothing like that. You're just going to win lucky numbers that will um that will be in a lottery by in the end of the week.

00:17:24

Rodrigo Porto: So you maybe you get drawn and win something in the lottery.
Alex Hay: Yeah,
Rodrigo Porto: But um if you share it,
Alex Hay: that's
Rodrigo Porto: the idea is to double the number of of the lucky numbers you got in that day. So you can double your your chances of winning the
Alex Hay: Got it. Yeah, absolutely.
Rodrigo Porto: lottery.
Alex Hay: So, yeah, we can link those to to things like what we would call sweep stakes entries. So, you know, if Yeah, to your example, at the end of the week, you've got a a draw for a I don't know, two t two tickets to a Brazil game, for example,
Rodrigo Porto: Yeah.
Alex Hay: you know, uh we can basically have those entries go into that sweep stakes uh for completing these tasks. We can do that. That's that's perfectly fine.
Rodrigo Porto: Okay.
Alex Hay: Uh this slide just talks to this gamification layer that I know that we spoke about last week. So this is how we sort of approach it. So obviously we've got first-timers.

00:18:20

Alex Hay: So the first time someone logs in, we encourage them to discover, you know, make some predictions or play trivia.
Rodrigo Porto: Is
Alex Hay: You maybe start to involve, get involved in a quest,
Rodrigo Porto: that
Alex Hay: which is obviously a group of tasks, you know. Then obviously we layer in the competition. So, you know, challenging others, they obviously get exposed to the leaderboard. Um, they can compete,

Rodrigo Porto: okay?
Alex Hay: they can level up, see themselves moving up that uh up that leaderboard and ladder and then we drive uh you know them into regulars and and invite their friends through that social community interaction. Invite them to return, invite them to share. And that's done through you know the quests and and competing and and all that sort of stuff. So this just sort of talks to the different um ways that we like to try and move people through that engagement funnel and the different elements that we use to do that are obviously the leaderboards that we spoke about on the last slide. It's the points and badges piece.

00:19:11

Alex Hay: So again we can figure out how you want to sort of utilize those different elements. I know that we've spoken about points. Um badging is also another great way to to encourage fans. So it might be like you know your first prediction badge. you know, they get a badge for that that sits on their profile. Um, could be, you know, their first correct prediction gets another badge or something like that. Again, we can come up with some fun and cool things. Uh, the quest and challenges, like I spoke about, it's a group of tasks. So, you know, how can we utilize those quests to encourage people to engage more and um go further with their use of the platform, whether that's making more predictions or spending more time there or inviting their friends or doing whatever. That's what quests and challenges are for. very similar with streaks and daily habits. So, a quest might be, you know, a three-day login streak or um challenge might be, you know, um play the uh trivia game three days in a row.

00:20:05

Alex Hay: So, by utilizing those question challenges, we're driving those streaks in daily sort of habitual behaviors um through that constant play. And then obviously the mini leagues as well. So, you know, we're obviously creating those friends leagues. you know, Rodrigo, me being able to invite you to my friends league, uh, and Patricia to come and take part in our league and and then we can play against each other, um, as well as obviously compete on the on the global scale and and everything. So, um, that just talks a little bit more about, you know, how we approach it from that gamification element and and the different elements we do bring into it. Um, and I know this again, this was

an important point, so just wanted to put this in there. um but about how we approach this uh you know community and social layer from a from a mini leagues perspective. So essentially we have the the global rankings which is the tournament um you know wide leaderboard to everyone um that you're competing for the major prizes. We can have public leagues which might be like you know um the Rio di Janeiro uh you know league where people can join um if they're from Rio.

00:21:09

Alex Hay: We might have then private leagues. So again, this is our friends and community leagues that you know we can all participate together. Uh and then we have premium leagues. So Roa, you're talking about obviously having your premium tier and only those users being able to participate in those specific you know competitions.
Rodrigo Porto: Yeah.
Alex Hay: This is how we would you know do that through what we call premium leagues. being able to tie that to an attribute that a user has.
Rodrigo Porto: Yeah.
Alex Hay: And only those types of users or or users with that particular attribute can participate in that. And what that really looks like is, you know, obviously we've got different activities here. This would be like an activity screen. And then within the leagues here, um this might be my uh my profile here. And I can obviously accept this friend request here from my friend or decline it if it's not my friend. And then I can go into my leagues uh and go in and view. Oops, sorry.

00:22:01

Alex Hay: And go into the different leagues which will obviously expose those uh those leaderboards for our friends league.
Rodrigo Porto: Yeah.
Alex Hay: So that's sort of something like how it would look and feel within like the profile section uh there. And then from there you can create a new league, you can join a league uh and that would be managed by codes.
Rodrigo Porto: Yeah, I believe that um but the create a new league or join a league can activate or deactivate based on the the the user profile. If he's a premium user, he can have like 100 leagues. If he's just a common user, he can have five leads and he cannot

create anyone any lead for example. So that's
Alex Hay: Yeah. So, we'll just have to work through how we manage that.
Rodrigo Porto: customizable.
Alex Hay: But, yeah, we we'll we'll figure that out. Whether it it just becomes uncclickable uh and that might be an opportunity for you to upsell them into that higher league uh or whether you want it to disappear completely. Uh it sort of just depends.

00:23:02

Alex Hay: Um, but you know there's a few ways to handle that from a UI perspective and that's something that we'll obviously pick
Rodrigo Porto: Yeah,
Alex Hay: up at a later date with you depending on sort of you know how you want to sort of manage that.
Rodrigo Porto: I I I don't know if I understood the difference between global rankings and public leagues. Um because I I think the global ranking is a public
Alex Hay: Sorry.
Rodrigo Porto: league. Yes, I public league it's uh it's a league inside the global if we want to do it like
Alex Hay: Yeah.
Rodrigo Porto: by state or city. Oh,
Alex Hay: Yeah. Exactly. So, this is like this example here where we've got the global leaderboard which is absolutely everyone and then in this example we've got a national
Rodrigo Porto: okay.
Alex Hay: leaderboard. So, players are basically uh you know allocated into their specific country. uh and they automatically get allocated into that private league uh sorry that public league there
Rodrigo Porto: Okay.
Alex Hay: um where you know they can see that they might be you know 10,000 overall in the global but in the national they're 3,100 so it's just another way that we gamify the experience so even if I'm doing

00:24:00

Rodrigo Porto: Yeah.

Alex Hay: really poorly on the global you know leaderboard I feel like I'm you know competing you know well in my national leaderboard so instead of people getting disheartened that not doing very well on the leaderboard. It's just another way to gify
Rodrigo Porto: Yeah. Okay. For us, maybe it's going to be just one global league because we we're going to have prizes.
Alex Hay: that.
Rodrigo Porto: So, it's if we have both both leagues, we have to double the prizes. So, it's going to be difficult to have both of them. So, maybe just
Alex Hay: So in this example, so this is actually Chelsea Football Clubs. So they only give prizes for the global leaderboard and that's really clear. Um but again if you think it would be confusing then yeah I would encourage you just to have the global leaderboard and then you have your friends legs options because that's really clear um on you know what the prizing is given for uh and and it comes back to a lot of the time it's just keep it simple you know u make it easy for people to

00:24:56

Rodrigo Porto: Yeah.
Alex Hay: understand how it works and and um you know obviously the UI we as you can see it's all pretty simple and easy to
Rodrigo Porto: Yeah.
Alex Hay: understand so um we try and keep it as as simple as possible.
Rodrigo Porto: Okay.
Alex Hay: Great. And then this just goes into the,
Rodrigo Porto: Yeah.
Alex Hay: you know, social quests and rewarding user actions a little bit more. So, um, you know, obviously from a quest perspective, you know, sharing two posts on social media, you know, comment to participate, you know, attend this for a reward. Again, all of these actions that we can track as part of this experience, we can gamify, we can encourage users to take those actions more often. U, we can encourage them to connect, you know, or whoops or share on social media. Um there's a lot of stuff here that we can go into, but again in terms of, you know, I guess this community and social layer that we can roll through these experiences. Um there's a lot here that we can we can look at.

00:25:56

Alex Hay: Again, I I do think it's a a situation where it's, you know, keep it simple and make it easy for everyone to understand not only how they can earn points, but also make it easy for, you know, the sharing to take place. Um and also for, you know, for for friends to be able to join because that's ultimately what we want, right? So, um, you know, that's sort of what we would recommend, but I just wanted to demonstrate these are all of the capabilities that we can pull on if we want. And then again,
Rodrigo Porto: Okay.
Alex Hay: I just wanted to sort of show this from a from a games hub perspective. You know, this is just a a bit of an example how we've done things previously. So, we've got, you know, points, we've got different tiers which we might want to use. You know, there's some sort of exclusive rewards. We can earn points through, you know, these different uh these different quests. Here's all the games that we have. This is an example of something we've done with Syria uh in the Italian league, obviously.

00:26:50

Alex Hay: So, for each match, they've got a a player of the match, they've got a starting 11 predictor game, they got a trivia game, they got a play predictor game. So, this is sort of how I would imagine, you know, similar for you guys. For each fixture, we would have a trivia game and we would have a player of the match game, or it might just be a player of the match game. Um, sorry, a play predictor game.
Rodrigo Porto: Yeah.
Alex Hay: Um and obviously the UI would be different but again this is just an example of how another customer has organized this um you know on their side. So this is their gaming hub from a Syria perspective. So just wanted to give you a view on
Rodrigo Porto: This is um Kazette in the future when we have our own SSO with with
Alex Hay: that.
Rodrigo Porto: all the games and and a unique profile for each user for everything.
Alex Hay: That's it. That's it. Exactly. That's this is what the future looks like.

00:27:39

Alex Hay: So yeah, we've even come up with like the tiered progression. So it's a fan, it's

a super fan, and then it's a Kaz Elite. Um so we can uh yeah, we can obviously do that. Um obviously from the reward store piece,
Rodrigo Porto: Yeah.
Alex Hay: you know, we haven't really scoped out there being any reward store elements with you guys. You know, being able to sort of claim benefits. Um but again, I thought I'd just put that in there because that is something we can do later down the track um if if that was a wish.
Rodrigo Porto: Do you
Alex Hay: Um but uh yeah obviously ignore that for this activation. So that was sort of I guess in terms of you know what the scope is that you've sort of passed on to me Rodrigo. uh wanted to sort of capture that in those few slides in terms of you know what this is actually going to all the inputs is going to you know sort of come together and because we do build these uh you know customized to each individual customer um you know just wanted to demonstrate all of those different inputs that we'll pull together to actually bring this to life uh before I go through you know a bunch of other slides which um you know are more talk to the possibility uh

00:28:39

Alex Hay: is there any questions on that does that make all make sense so
Renato Drumond: No, until now everything's clear.
Rodrigo Porto: Alex, uh, I have two different points. I don't know if it's, uh, the right time. So, I'm going to ask those questions and then if Yeah.
Alex Hay: Go for it. Go for
Rodrigo Porto: So,
Alex Hay: it.
Rodrigo Porto: the first one's about the uh if we don't have a sponsor, we still going to have the premium league and in that case, we will have to to charge the users to to get in to join the the premium league. So is this is there a solution to the billing process inside the platform
Alex Hay: Sorry. As in um what what do you mean by that?
Rodrigo Porto: have a partner like Stripe or something that can process payments?
Alex Hay: Oh, do we have a partner that can process payments? Uh not out of the box,
Rodrigo Porto: Yeah.
Alex Hay: but again, if if you guys wanted to acquire Stripe, we can implement it as part of this.

00:29:46

Alex Hay: I sort of understood this premium league from your perspective as you know uh those two different types of
Rodrigo Porto: Okay.
Alex Hay: users. So you've got the free user and then you've got the premium user. That was what I was understanding this for.
Rodrigo Porto: Yeah.
Alex Hay: So you know obviously I think you used the example the other day if there is an Amazon Prime customer or an Amazon customer then um they could participate in that league.
Rodrigo Porto: Yeah.
Alex Hay: That was sort of more what I was talking to there. Um, I hadn't considered there being a uh a sort of a payment gateway as part of this, but again,
Rodrigo Porto: You're right.
Alex Hay: if if you wanted that, we we can do
Rodrigo Porto: Yeah, you're right. We are going to that that type of scenario where an Amazon Prime
Alex Hay: that.
Rodrigo Porto: will already have um access to the premium league. like Patricia is saying that imagine if all the the commercial the commercial um partners all failed and we we don't have any partner.

00:30:38

Rodrigo Porto: It's a tragic scenario. I don't know maybe it happens. So in that case we're not just going to um not do the game. We're going to to still um do the game, but we will need to charge premium users directly from the game with
Alex Hay: Got it.
Rodrigo Porto: a payment um partner. It's not the first scenario, but maybe it it's just to understand if it's possible if we need to to have this scenario.
Alex Hay: Yeah, I mean we can do it. Yeah. Um that's fine. We do power membership programs uh as well which are all gated via a um you know a payment processor like Stripe. Uh so it's all possible. Um, one call out with the sponsor will be that we'll have to

figure out a way to authenticate that the user is part of the sponsor ecosystem. I don't know how that would work. I'll have to bring in the technical team to obviously work through that. Um, but that would that would require an integration into some form of authentication

00:31:36

Rodrigo Porto: Yeah.
Alex Hay: whether that's a login to the sponsors platform or I don't know but that would be required as well.
Rodrigo Porto: Okay. And and Alex, for this this scenario, do you have a a way to give us an estimate cost of this scenario if we need to go through this one?
Alex Hay: as in a cost or a or a time perspective.
Rodrigo Porto: Uh both of them.
Alex Hay: I can find out. I'll have to take that as an action.
Rodrigo Porto: Okay.
Alex Hay: Cool. I'll keep flying through and I'll go through pretty quickly here. Um, but you know, we just wanted to sort of, you know, showcase that we do have over a 100 mini games that you can choose from. Um, you know, a variety of formats, skill-based, knowledge based, and chance based. Um, so these are all out of the box, can be rolled out really easily and quickly. Um, and they definitely do sort of appeal to different types of of fans and and different activations. Um, these are examples of some skill games that we've got like, you know, flick to kick and all that sort of stuff.

00:32:43

Alex Hay: These are just lightweight, easy to to deploy games. Uh chancebased games just like you mentioned before the spin the wheel or you know the sweep stakes in terms of entering your data and going into a competition. Uh we do have an piece of AI that sits behind all this as well to help um power this. I don't know how relevant this would be obviously for your engagement but um we do have that as well. just a little bit of information about why the mini games work um in terms of you know just the Oculus framework in terms of the different motivations that that people have when they're actually uh participating in these different experiences um again I'm not going to go into these in depth now um data capture and monetization uh again I I'll leave you guys to

sort of review these in your own time but this really goes into more of those in-depth questions that you had Rogo in terms of you know um you know who who's data like how are we managing the data where does that live um you know how we can you know obviously uh direct that into revenue how we can you know make these sponsorable in terms of the you know different engagements the technical requirements which I know that you had quite a few questions about so this should answer most of them I know that we've obviously been through them on our previous call but um we put this all in here as well

00:33:58

Alex Hay: so that you've got this as a as a reference point um security measures you know multi factor authentication, SSO agnostic, uh architecture, where we sit, how it all works, um you know, infrastructure perspective, uptime, sock 2, etc., etc. Um, you know, performance and scalability. Uh, so, you know, just talks to sort of, you know, 82 million profiles, 320, you know, widget impressions. So, there's a lot of, you know, scalability there. um you know in terms of bleacher report just some some insights on you know some of the data and and and the capacity that we're managing uh as part of that client that we work with some work estimations there so we estimate around about 8 weeks work depending on you know once the scoping is complete obviously things like stripe things like you know other potential integrations that we haven't thought about may push this out um so obviously you know there is important timing considerations here um but you know we've sort of put together somewhat of a a bit of a um road map here and and how we would attack that from a you know from a from a step perspective and also from a detailed perspective and what we would be tackling as part of each of those um each of those stages including you know obviously the the strategy and and the sort of product ideation um the requirements capturing the build

00:35:21

Alex Hay: design you know UAT and load testing and then deployment uh obviously some roles responsibilities. I know that we spoke about this a little bit, but um you know just operational autonomy, the ability for you guys to actually manage this on your end as well post post launch. Um there is some structural components here um that we'll obviously take care of uh in terms of making sure that everything stays up and then um

the operational mode as well. So the ability to sort of manage throughout the tournament. Uh just a few points about you know again while we're a good partner experienced team successful account management team and and strong knowledge in the sports and media space. We've obviously been there done that in terms of you know all of these types of experiences including World Cups. Uh so you know we've sort of done it. Um, how we would do this is we would have uh probably not daily stand-ups with you guys for this example, but probably weekly meetings to make sure that we're staying on track uh to basically deploy this in a really, you know, efficient manner given our close time frames here.

00:36:27

Alex Hay: Uh we would obviously manage the backlog and make sure that everything from an integration standpoint was uh being managed effectively. And then there would be demos and reviews throughout um as we you know were going through the the design process especially in terms of making sure that it aligns to you know what our pre-agreed um you know product would look like and feel like and and the functionality would all be there.
Rodrigo Porto: You're going you're developing the UX and the front end and we're validating on our side, you know, on a weekly basis, something like that.
Alex Hay: Correct. Yeah.
Rodrigo Porto: Yeah.
Alex Hay: Um we would obvious we would also so as part of our support we have uh obviously email we have a slack channel that we set up which is for obviously you know quicker answers. So you know we might have some uh you know some some design elements that are ready on a Tuesday but our meetings on the Friday you know we'll send them to you on the Tuesday and just go you know please review these ahead of Friday.

00:37:20

Alex Hay: Um or if there's any initial feedback please let us know. Um so there's there's obviously more of that engagement throughout the week as well. not just sort of specifically for that one session. Um documentation and support. Uh we've got a whole website which can be found through this link here uh which has all of our

documentation for all of our um platforms, our support um you know integrations, everything. It's all there uh which you can integrate in your own time. Uh and then it talks to our support services as well. In terms of the support services, we've got as I talked about the user support. So you know obviously assisting with you know the technical side of things problem correction so you know any bug fixes um any functional behavior anything like that uh and then application enhancement. So you know that again this one probably a little bit less relevant for you guys given that it is such a defined scope. Um this is probably more applicable to you know ongoing use cases.

00:38:15

Alex Hay: Um but obviously you know if you guys were to keep going with this then you know obviously in terms of those upgrades and improvements we would work with you on that. Um I know there was a question about prioritization.
Rodrigo Porto: Yeah.
Alex Hay: So we do have a 321 priority uh in terms of the um you know any issues that are identified. Uh so one is essentially a critical application level uh you know problem
Rodrigo Porto: All right.
Alex Hay: which would basically trigger immediate response. Uh second is I suppose an unusable or or an important application function again that triggers a very immediate response and then three uh tends to be you know slightly slower but you know more reduced functionality or or or issues with performance. We would obviously jump on that straight away as well but um you know it's not as critical as the other two. So it's just how we prioritize things. Um again those business uh response times as you can see there um we do monitor it 24/7 uh so you know outside of business hours there is also still that you know response time and assessment.

00:39:17

Alex Hay: Uh obviously the commercials uh that are there um the pricing does include 10 million users um because obviously that was the number that you quoted in terms of um I suppose the the total amount we have basically got to that number through each 1 million trench equaling 20 grand. Uh so that's obviously if you do the simple maths it's how we reach that number. Um but yeah that's pretty much it I think and then we do we did put a credit based services in here as well just because um you know once the

system is live we tend to find that customers do you know need iterative work you know oh can we change this can we do that can we make that adjustment instead of having to continually issue you state statements of work. it just works so much better on both sides to have that, you know, that credit base there to be able just to make those upgrades and changes, especially in a tournament like this where, you know, there is a really quick turnaround period. Um, we don't have time to do so.

00:40:10

Alex Hay: So, um, and that just explains a little bit more about that and what that looks like. And then, yeah, that's that.
Rodrigo Porto: Okay. Right. Support. Mhm.
Renato Drumond: I believe that we cover all the points.
Rodrigo Porto: And um I I have just one extra point about the the support for the final user. Uh if we do if you do have um
Alex Hay: Yeah.
Rodrigo Porto: any any partner or any any way that we can handle this uh inside the the the platform inside the the the prediction game. Can we have like u a chat? I don't know. or just is it just an email that the user can can communicate
Alex Hay: Come on.
Rodrigo Porto: with us? And you you mentioned also a CMS where support team can can have access. How how does that work?
Alex Hay: Yeah. So, typically we don't um let's have a look here. Typically we don't um you know deal with any end customers because obviously they're your customers.

00:41:38

Alex Hay: Um, just having a look
Rodrigo Porto: But Alex, in the other products,
Alex Hay: here.
Rodrigo Porto: h how does it work when the the users have some trouble logging in or using the the the platform?
Alex Hay: Well, because all of our um customers utilize, you know, let's just say um I mean, we've mentioned Chelsea a few times. So Chelsea Football Club, we integrate into their single sign on system, which is basically owned and managed by Chelsea. So

they're not logging into a brand new system that we've created over here. It's actually logging into the actual Chelsea, you know, app itself is is the problem. Um so that is dealt with on their side. We only power the um you know, the actual experiences themselves like the prediction game, like the leaderboards, like all those sort of stuff. Um if there is problems with that, Chelsea will alert us and we'll deal with that. Um that happens very rarely.
Rodrigo Porto: Okay.
Alex Hay: Uh but in terms of the end users, we don't deal with the end users.

00:42:43

Alex Hay: Um I can ask the question internally about whether we have any partners or anything or or
Rodrigo Porto: Okay.
Alex Hay: what dashboards we could potentially use. But typically what we'd recommend is yeah, just providing a you know an info at or a you know a support email that people can can send through any issues. Um, and then in terms of, you know, I guess the the points allocations and and that side of things because that's all happening on our end through APIs and through, you know, I guess the widgets and and the games that we own. Um, we can see that on our end. So, um, if there's anything that's broken in terms of, you know, uh, Rodrigo is not getting his points for his predictions, we can see that on our end and and our engineering team will identify that and remedy that. Um that would be obviously a lilike issue to sort um and something that we would obviously figure out.
Rodrigo Porto: Okay.
Alex Hay: But in terms of actually managing the end users uh it's not something we

00:43:39

Rodrigo Porto: Okay. Yeah.
Alex Hay: do.
Rodrigo Porto: Okay. Um uh do you have any other question? Uh I think so. No, because I think Alex for us it's important to to have another call with the the technology person of Kazet and I don't know if you need anyone from your side that
Alex Hay: Mhm.

Rodrigo Porto: can talk about architecture and things that we don't know how how does it really work. So, uh maybe it's important to to have this this this extra call
Alex Hay: That's totally fine. I'm more than happy to um to jump on an engineering call and I'll definitely bring a member of my team. uh on the engineering side to you know answer any specific engineering questions as well. Um yeah I can answer to a level but there's a level where it goes out of my head. So uh yeah that happens very
Rodrigo Porto: Yes.
Alex Hay: quickly.
Rodrigo Porto: Yeah. Yeah. Maybe an hour maybe tomorrow or Thursday max Friday
Alex Hay: Yep.
Rodrigo Porto: we have a choice. Yes. So we can talk with the the person from Kaz and and and and get her her agenda and then we can share share it with you.
Alex Hay: Perfect. No worries. Yeah,
Rodrigo Porto: Yeah.
Alex Hay: I've got uh there's there's I'm just looking at my calendar and our CTO's calendar. We've got we've got some time tomorrow. There's a few gaps tomorrow afternoon, so that should be fine. Um or or Thursday afternoon is also okay.
Rodrigo Porto: Okay.
Alex Hay: Um, so yeah, you let let us know what what works on your end and I'd be more than happy to organize that. In the meantime, I'll I'll follow up on the on the Stripe piece. Um, and there was one other piece that I was going to follow up on as well. Um, my notes will capture it. Yeah,
Renato Drumond: Okay, thanks for
Alex Hay: my pleasure, Ronaldo.
Renato Drumond: presentation. Okay, perfect. Thank you.
