## Summary

Single Sign-On strategy was discussed, with independent SSO leveraging account linking prioritized for rich user data retention and future commercial value, contrasting with sponsor-led SSO limitations.

**Independent SSO Strategy Decided**
The team debated 2 Single Sign-On options, concluding an independent SSO with account linking is required to meet the May 11th deadline while retaining user data. Data ownership is the primary concern, as embedding the solution in a sponsor's app via their SSO would prevent Kazia from owning user information.

**Cortex Account Linking Functionality**
The Cortex platform's account linking feature was confirmed as crucial for building rich user profiles by connecting unique sponsor IDs to the SSO profile. Data retention for future commercial activities is the true value of the independent SSO, but internal stakeholder and sponsor confirmation is required.

**Deployment and Technical Needs**
A quick, micro-site solution utilizing standard Open ID Connect flow is recommended for timely deployment, with the primary dependency being

the domain where the SSO will be hosted. The platform features autoscaling capabilities crucial for handling the expected 15 million user spikes that occur 5 to 10 minutes before a game.

## Details

- **SSO Strategy and Sponsorship Impact**: The discussion centered on the necessity of a Single Sign-On (SSO) provider by the May 11th deadline, considering two options: securing a sponsor whose existing SSO could be used, or implementing an independent SSO. If a sponsor is secured, the team must determine if the sponsor's SSO is usable; if not, or if no sponsor is found, an independent SSO is 100% required (00:00:00). Potential sponsors are identified in the betting app, delivery, and e-commerce sectors, each presenting different risk profiles regarding their potential SSO mechanics (00:00:58).
- **Sponsor SSO and User Data Ownership**: A scenario was discussed where a web solution is embedded into a sponsor's application, requiring users to log in via the sponsor's SSO for the prediction game (00:01:56). Rodrigo Porto noted that while this scenario facilitates the game's operation, the owner of the game, Kazia, would not retain any user information, which they view as "bizarre" (00:03:38). Ben Hayward and Sharon Tuff suggested a "third way" using an independent SSO with account linking functionality, which would allow Kazia to retain long-term data for future commercial activities and leverage the SSO across multiple events, such as the World Cup and Olympics (00:04:48).
- **Leveraging Account Linking for Rich User Profiles**: Ben Hayward explained that the Cortex platform offers "account linking" functionality, commonly used in sports for connecting retail or ticketing accounts. This feature allows the linking of unique IDs, such as a Door Dash account ID, to an SSO profile, thereby building a rich profile of the individual across various sponsors and events over time (00:05:40). Rodrigo Porto agreed that this data retention and profile building is where the SSO's true value lies but noted that they must internally convince stakeholders and confirm if the sponsor, such as the Brazilian Door Dash company, is willing to share user data (00:06:39).
- **Next Steps and Required Materials for Internal Pitch**: Jack Carter and Sharon Tuff offered to help Rodrigo Porto communicate the value of the independent SSO route internally, with Rodrigo Porto requesting specific materials by Friday to

support this internal discussion. The requested materials include a project timeline with milestones, necessary information from the Kazat side to meet the May 11th deadline, and a business proposal outlining the costs (00:07:46). Jack Carter confirmed they can provide these items by Friday (00:08:59).

- **SSO Deployment Options and Technical Dependencies**: Ciaran Fisher explained that given the time constraints, building a custom front end for the SSO is not feasible, so they recommend deploying a quick, micro-site solution that can be branded and customized from their end (00:08:59). This solution utilizes a standard Open ID Connect (OIDC) flow, making integration with third parties like LiveLike relatively easy, and it can be upgraded to a fully bespoke front end in the future without needing to refactor the entire system. The primary dependency from Kazat's side is knowing the domain where the SSO will be hosted (00:10:05) (00:12:08).
- **User Experience and SSO Deployment Scenario**: Ciaran Fisher described the typical user flow when the predictor is embedded in an app: the user is directed out of the app to a web browser for login, and then pushed back into the app with an authentication token (00:13:26). Rodrigo Porto shared a prototype of the prediction game's user experience within an external app, demonstrating the onboarding flow that requires the user to create a username and select basic information before starting the game (00:14:33). Rodrigo Porto requested an example of the micro-site and documentation on how the imagined SSO experience would work to share internally, with Ciaran Fisher suggesting Arsenal's app as a good reference (00:13:26) (00:18:45).
- **Architecture and Licensing Structure**: Rodrigo Porto inquired about the architecture to understand how Kazat can maintain access and continue working post-World Cup, asking about free access and management. Ciaran Fisher clarified that the solution is a Software as a Service (SaaS) platform, managed and hosted by Cortex, which means the micro-site and SSO are hosted by Cortex (00:21:10). The options post-tournament are either turning it off and exporting all data to Kazat or continuing the service based on an annualized license fee, which can be structured in multi-year increments (00:22:20).
- **Performance and Autoscaling Requirements**: The team discussed the need for robust performance, especially during peak periods, as a previous prediction game broke down a bank app due to concurrent users. Rodrigo Porto emphasized that over 70% of their users wait until the last 5 to 10 minutes before a game to submit their final predictions, leading to massive spikes in activity, and

they are planning for at least 15 million users (00:24:06) (00:30:39). Ben Hayward confirmed that autoscaling is a fundamental feature of the sport-specific SSO piece, designed for automatic scalability during match peak periods (00:28:43).

- **Cortex SSO Unique Features for Sports**: Jack Carter and Sharon Tuff highlighted unique features of their sports-specific SSO that address Kazat's needs, including the ability to handle junior accounts (aged 13+) separately from adult accounts and heavy investment in security via multi-factor authentication (00:18:45) (00:26:34). They also emphasized features like bot detection, password security recommendations, and "entitlements," which allow for gating content and privileges based on different tiers of users, such as premium subscribers versus normal registrations (00:27:28). Ciaran Fisher confirmed the platform currently only needs to support Brazilian Portuguese (00:29:39).
- **Proposal and Follow-up Meeting**: The proposal will include the unique features mentioned, examples of live work, project timelines, and commercial details, scaled to accommodate the expected 15 million profiles (00:29:39). Jack Carter committed to sending the proposal materials by the end of the week, and the team scheduled a follow-up meeting for the following Monday at 5:00 p.m. UK time (1:00 p.m. Brazil time) to review the proposal (00:31:48).

## Suggested next steps

- [ ] [Jack Carter, The group] Submit Proposal: Prepare comprehensive business proposal detailing costs, fees, and tiering structure. Deliver project timeline, milestones, live work examples, micro site links, SSO experience material, and client scaling metrics.
- [ ] [Jack Carter] Schedule Follow-up: Send meeting invitation for Monday at 5 PM UK time / 1 PM Brazil time.

# Cortex Intro_ Placeholder. - Transcript

## 00:00:00

**Rodrigo Porto:** Thank you. Sorry, Jack. Can you ask
**Jack Carter:** Yeah, all good. So, yeah,
**Sharon Tuff:** Okay.
**Jack Carter:** just just thinking on that that 11th of May timeline and what needs to happen between now and then.
**Rodrigo Porto:** again?
**Jack Carter:** Is it at the moment you're looking for an SSO provider like Cortex and then the other option will be if a sponsor comes with their own SSO they've already got and and now it's just a really
**Rodrigo Porto:** Yeah.
**Jack Carter:** like a decision between the two.
**Rodrigo Porto:** Yeah. That's basically it. Um, if we have a sponsor, we have to understand if it will will be possible to use the sponsor's SSO. That's a question we have.
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** Maybe we can have a sponsor but not use it not use it SSO. We will need to have our our own, which I don't think it's bad. As Sharon said, we can we can have our our users um login data with us. um or if we don't have a sponsor, we we'll 100% need to have our SSL.

## 00:00:58

**Sharon Tuff:** Rodrigo. And so I just jump in here.
**Rodrigo Porto:** But
**Sharon Tuff:** Are there specific categories? What are the categories that you're looking at for sponsorship?
**Rodrigo Porto:** yeah,
**Sharon Tuff:** Because we'd probably be able to give you some guidance as to whether

the types of SSO mechanics they might be deploying would even be fit for purpose for the cadence of sport. Uh so it will it the risk profile of that probably looks differently subject to what industry the sponsors are coming from.
**Rodrigo Porto:** yeah, we are we have um three possible sponsors that are betting um apps and that's a risk.
**Sharon Tuff:** Okay. Yeah.
**Rodrigo Porto:** Um we have one um possible sponsor there. It's it's like a Door Dash um relative.
**Sharon Tuff:** Yeah. Yeah. Yeah.
**Rodrigo Porto:** Yes. But from from Brazil um the delivery with they deliver
**Sharon Tuff:** Yeah. Yeah.
**Rodrigo Porto:** everything and Yeah.
**Sharon Tuff:** I can deliver.
**Rodrigo Porto:** And an e-commerce um sponsor as well.
**Sharon Tuff:** Okay. Okay. All makes

## 00:01:56

**Ben Hayward:** Rodrigo,
**Sharon Tuff:** sense.
**Ben Hayward:** could I quickly ask very briefly um so you the intention behind potentially exploring a um a sponsor is the aim there so that you can um attach user profiles to their um uh engagement with the uh the live uh live like um predictor. And the reason I ask that is because actually um obviously we present as you know a sports specific SSO. we have the capabilities built into the product straight out of the box to actually link uh to a sponsor's database for example to their um to their login but utilizing for instance our SSO which as we can talk about in a bit potentially comes with that advantage of actually having the the the um built-in functionality of handling huge spikes in your in in the user signing up and all that type thing. So I just wanted to understand a little bit about the requirement behind that and the the the purpose I guess behind why you're also having a look at at sponsor SSO for that for that functionality.
**Rodrigo Porto:** Um, let me see if I if I got it right what you're asking um in a scenario where we're going to um be using uh a sponsor just let me get put a get a a step back so you understand why why why I'm talking about the the SSO the sponsors SSO the when when we're we're talking about um creating a web solution and embedding into a sponsor So that 100% of

## 00:03:38

**Rodrigo Porto:** the users that will be joining our prediction game needs to be logged in into our sponsors application. So they are already inside their sponsors SSO. Um with that
**Sharon Tuff:** Yeah. So you're selling it you're selling it as a as a game to a sponsor that they can take
**Rodrigo Porto:** we
**Sharon Tuff:** that then that functionality into their digital ecosystem. So it's there it sits behind their SSO which means you don't need to do it.
**Rodrigo Porto:** Yeah.
**Sharon Tuff:** So really it's in the event that you are not successful in selling sponsorship that you need a a plan B
**Rodrigo Porto:** Yeah.
**Sharon Tuff:** to be able to kind of have your own independent SSO. Um, but there's obviously more value to you as a business and your stakeholders for doing that.
**Rodrigo Porto:** Yeah. Yeah. It's kind of that because um in the end if if we were
**Sharon Tuff:** Um,
**Rodrigo Porto:** not in the end the prediction game is from Kazia but there is a scenario where we're using the sponsor's SSO and live like is connected directly into that that sponsor's SSO and the the game's working but with that scenario Kazet who is the owner of the game doesn't have any information of the users which I

## 00:04:48

**Sharon Tuff:** Yeah.
**Rodrigo Porto:** think it's really bizarre. are but internally here they they don't they not like I'm thinking for that.
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** Um
**Sharon Tuff:** But I wonder if what Ben is articulating is if there's a third way where you have it in a third
**Rodrigo Porto:** yeah
**Sharon Tuff:** space and actually you know the sponsor still gets the the value still

getting
**Rodrigo Porto:** yeah
**Sharon Tuff:** the data but actually you don't have to put it behind their SSO. So then you can still have leverage the value of long-term data and that can support what you do in other commercial activities for your stakeholders even if they don't see how they can activate that first and zero party data. I think that's where we could really drive a compelling um solution for you that would be future proof because then you can
**Rodrigo Porto:** Yeah.
**Sharon Tuff:** roll from football world cup to women's you know football world cup to all of the elite you know
**Rodrigo Porto:** Yep.
**Sharon Tuff:** rights that Olympics um in European
**Rodrigo Porto:** Yep. Yeah.

## 00:05:40

**Sharon Tuff:** sport.
**Rodrigo Porto:** That that's the best scenario in my opinion.
**Sharon Tuff:** Yeah. Yeah.
**Rodrigo Porto:** Okay.
**Sharon Tuff:** Okay.
**Rodrigo Porto:** Um we we have our SSO one way or another um having or not having a a sponsor.
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** Um and then we can really use that in in the
**Ben Hayward:** So we we we have that kind of functionality as I said it's called account linking uh and we use it all the time across
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** future.
**Ben Hayward:** the world of sport. We primarily use it for things like linking retail uh platforms which actually might be quite useful for what you were describing uh right at the top of the call but also linking like ticketing accounts and that type of thing but also obviously if you've got door dash that with your door dash account you'd have a unique ID we can link that to somebody's SSO profile and over time as you then activate the SSO across not only the World Cup but as Sham was saying all sorts of other events further down the line you then build up an incredibly rich profile file for that individual with all of their different linked accounts across your different sponsors and you really

understand so much more about them.

## 00:06:39

**Ben Hayward:** It becomes a real kind of uh uh you know it adds longevity to the to the investment in in something like an SSO and it can actually be spun out into all sorts of different other things. It's not just like you you spin it up for a month or so and then get rid of it.
**Rodrigo Porto:** Yeah.
**Ben Hayward:** You actually get to keep the data of the invert.
**Rodrigo Porto:** Yeah. I I think that's that's really that's the that's where the value is on on the SSO. um just need to convince people here about that and also understand that if like the the Door Dash um company from Brazil is willing to accept the to share those those informations in the end there are users from that their app they're accessing the app organically maybe but also in our in our CTAs in our broadcast um So they turn they in the end they are use they are used from from Nordash but also they end up being users from Kazativ but they they'll have to accept that that share of

## 00:07:46

**Sharon Tuff:** Yeah, absolutely. Okay, we'll give some thought to that and how we can help you sell that in.
**Rodrigo Porto:** information
**Jack Carter:** And yeah, that's the point I was going to look at,
**Sharon Tuff:** Um,
**Jack Carter:** Rodrigo, really. It seems like um how do we support you transferring this sort of value message across to the rest of your team? Because it seems like this is probably the route that you you think makes the most sense.
**Sharon Tuff:** you know,
**Jack Carter:** I'm not trying to put words in your mouth, but but how do we support you in this and go getting this this message spread a bit wider so that come end of April, we can launch and actually get to uh get to that 12th of A date.
**Rodrigo Porto:** I I my my intention here was first to understand um if there if time is looking at the time we have if it's possible Right. Um, and what are the the possibilities in with the project? Um, maybe we can maybe you can um set up like a a timeline of the

of the project and also with the the milestones and the whatever information you you maybe would need from from our side to to make it happen until the the 11th of May.

## 00:08:59

**Rodrigo Porto:** Um also a a business uh proposal of course
**Jack Carter:** Yeah.
**Rodrigo Porto:** the costs um I think though those are the two main materials that I' I'd like to have maybe till Friday. I don't know if it's possible,
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** but we we have to to run as you said,
**Jack Carter:** Yeah, no. We certainly can get something big. Sorry,
**Rodrigo Porto:** J.
**Jack Carter:** I've got really bad hay fever. That's why I keep rubbing my eyes. I'm not crying.
**Rodrigo Porto:** No
**Jack Carter:** Yeah,
**Sharon Tuff:** Awesome.
**Jack Carter:** we can certainly get that stuff that those bits across to you um by Friday.
**Rodrigo Porto:** worries.
**Jack Carter:** Um I wonder if there's anything Ben or Kieran you could you could share at a high level for for t what dependencies we we need um between between now and 12th of May.
**Ciaran Fisher:** Yeah, we basically got to talk to us. So one is um API based where the partner builds a custom front end. Um so we talked we just reason I was late to this call actually was I was another call with live like light for a different customer where live like you're going to be building a a custom front end for the SSO given the time scales for this that's not really a goer I would say.

## 00:10:05

**Ciaran Fisher:** Um so we have a quick to deploy micro site. Um, so we can send some links after the call, but we can deploy something. It can be branded, it can be customized from our end. Um, can only support one brand, but you can rebrand it as many times as you like. Um, and that will be basically like a login something.com

**Rodrigo Porto:** Okay.
**Ciaran Fisher:** or whatever. Um, from a dependency point of view, we just need to know where the domain will be. Um and after that it's relatively quick to spin up the third parties integrating with it such as live like it's a standard um it's called open ID connect I don't know if you come across it but it's a OIDC um connect so open ID open ID connect flow it's standard so it's relatively easy for other parties to to integrate with um and we can point some documentation around that as well for those third parties but it's relatively quick to spin up Um things like preferences or opt-ins as well you can customize. So if you want to have a particular optin for a particular brand or a particular sponsor, you can do that.

## 00:11:13

**Ciaran Fisher:** You can go create it and then later on you can it it's all it's all there as part of the part of the system and that's that's quick to deploy. Um I just the only caveat on that is it's it I mean it has it has customization built
**Rodrigo Porto:** Yep.
**Ciaran Fisher:** into it but it's never going to be as customizable as a fully bespoke solution. But it's it's fine from my point of view.
**Ben Hayward:** just just to emphasize though, the that solution is explicitly designed to be um deployed incredibly quickly as Kieran
**Rodrigo Porto:** Yeah.
**Ben Hayward:** said, but it does allow you to actually upgrade that to a fullyfledged bespoke um front end at some point in the future whenever you want to. um depending on you know the the what live likes uh timelines are like etc.
**Rodrigo Porto:** Heat.
**Ben Hayward:** So it you don't have to refactor everything.
**Rodrigo Porto:** Okay.
**Ben Hayward:** You just take what you got and you iterates upon it.
**Rodrigo Porto:** Okay. Cool. Um uh I think that I we we can't answer yet.

## 00:12:08

**Rodrigo Porto:** Um for example, the domain um things. We we don't know exactly how that going to work yet. Um, as I said, maybe we're maybe we're it's a possibility that

we're going to have our own domain on our web domain, but we're not or it's just going to be embedded in a in an app. So maybe we can um work together with livelike in that situation to understand how we can deliver that um SSO bot in the the experience h how how is the the all the the customer
**Ciaran Fisher:** Yes.
**Rodrigo Porto:** um paid all the all the he his experience in into logging in into the the the app but also logging in into the the prediction game. How exactly is it going to work? I think maybe we would have to understand that a little bit more or maybe there's there's no no f friction in that. It's just like the moment the user joins the prediction game he will automatically as Ben said um authenticate account linking I don't
**Ciaran Fisher:** That's it.
**Rodrigo Porto:** know have to

## 00:13:26

**Ciaran Fisher:** Yeah, that's usually the flow is is that you would so if this is embedded in an app,
**Rodrigo Porto:** understand
**Ciaran Fisher:** you would go to the predictor section in the app. It would say, "Hey, you need to log in." It would take you out of the app to the web browser. You log in. The web browser pushes you back into the app and says, "Hey, Rodrigo's logged in. Here's his token." And they take it from there. Um, so it's relatively straightforward. There's a
**Rodrigo Porto:** Okay. Yeah. May maybe we can we can have see like a material or something like that um on how the how you imagine that experience or that I can show internally um how it would work would would look like um if we uh have that
**Ciaran Fisher:** Yeah. Yeah, we can examples.
**Rodrigo Porto:** solution.
**Ciaran Fisher:** Probably Arsenal's quite a good example with um with a nice app and um SSO integration. That's ours. There's a few
**Rodrigo Porto:** Okay. I don't know if um Alex showed you like u like a a prototype um that we that I created um this.

## 00:14:33

**Sharon Tuff:** No, but that would be amazing to

**Rodrigo Porto:** Okay.
**Sharon Tuff:** see.
**Rodrigo Porto:** So let me show you um will make everything easier for you to understand. So let me plug in here preview. Let me share here. See my screen.
**Sharon Tuff:** Yeah,
**Rodrigo Porto:** Yeah. So,
**Sharon Tuff:** brilliant.
**Rodrigo Porto:** I made it in there like in like the Brazilian Door Dash. Okay. So, this is the CTA for a prediction game called in in let me put it in H. Yeah. Um, so the prediction game it's it's popular popularly called Bolog. It's a really popular game. So we have the CTA here, the big banner. You click on it and then you are already logged in into the the app. So we we thought that um we would only need to for the user to create his his username. I don't know. Let's let's put here Cortex. Choose some information. I'll put England here to be happy. Then you start the game.

## 00:16:12

**Rodrigo Porto:** There's an on boarding here. Okay. I just pass. It's not really important. Um so this is um the main features of the game. So you have a a so you have a a question and answer every day. So you can um win some lucky numbers. Here you have the actual prediction experience. Okay. So you can put on the whatever scores each of the games on the games you have some different types of prediction. You have a you can choose who do you think is going to be the winner. um which player is going to have win the golden boots and until when Brazil is going to to reach each phase. Then you have the rankings, the public leagues. So you have the normal public league here that we're calling as the the common users. I'm not going to detail that right now, but you have two different leagues here. Okay, leaderboards. You have the common players leaderboards and you have the premium players leaderboard.

## 00:17:21

**Rodrigo Porto:** Okay, everyone here is is is a premium user and you can also um create leagues with your friends. You can put here
**Sharon Tuff:** Amazing.
**Jack Carter:** Sounds

**Rodrigo Porto:** friends create your league here and that's it.
**Jack Carter:** great.
**Rodrigo Porto:** And you can also invite um the influencers from Kaz to to play on your private league. Okay. You have yeah you have um missions like you can earn points. You have to be challenged into some mission. You have a a due date for each mission. Then you can earn prizes there. This is just information about the the currency um prizes. And you have the user profile. That's basically it. Oh, there there's a like a like a badge system also. When something you get a match, right, you get a badge, for example. Basically, that that's the the the whole game um experience. Okay. So, all all that um in the the beginning the beginning of the the ling is the ones we're most concerned about right now.

## 00:18:45

**Sharon Tuff:** And if you don't work with a betting partner, are there any kind of age restrictions that you need to be cognizant of for this? Or is it universally open to all?
**Rodrigo Porto:** It's open.
**Sharon Tuff:** Can kids play?
**Rodrigo Porto:** Sorry.
**Sharon Tuff:** Can children play?
**Rodrigo Porto:** Yeah. Up to um after 13 we have the legal terms um 13 or older.
**Sharon Tuff:** Okay, brilliant.
**Rodrigo Porto:** But I don't know that that that's what we're we're just a mockup of course. Um and would like to understand what would we need to to change here in this these steps until the the login um with how how it would work. So I think that that's like some some material that would be nice for us to to have to try to show here at Kazat.
**Jack Carter:** Yeah, we can definitely get that across. I think the um we can give you an example of a micro site as well of what it could actually look like um like for for an app user aselves.
**Rodrigo Porto:** Yep.
**Jack Carter:** So actually showing what it would look like as you go through this journey

## 00:19:58

**Rodrigo Porto:** That would be perfect.

**Jack Carter:** too.
**Rodrigo Porto:** Yeah. here. Bam.
**Jack Carter:** They were all the questions I had. I'm not sure if Cortex team there was anything else you guys wanted.
**Sharon Tuff:** So I think is it worth just touching on some of the requirements? I think there were a couple of questions that we had there. Um
**Rodrigo Porto:** Yeah, sure. Go
**Sharon Tuff:** Um so particularly um
**Rodrigo Porto:** on.
**Sharon Tuff:** so I think we're clear on the kind of documentation that we need to follow up with in ter you specifically referenced architecture documentation. Um what what specifically were you driving at with that um request in the brief?
**Rodrigo Porto:** I don't know if I got it. What was the question
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** specifically?
**Sharon Tuff:** So you were asking for architecture documentation in the brief. I was just wondering to get a little bit more clear on exactly what you mean by that.
**Rodrigo Porto:** Oh, let me see. Just a second. I don't remember.

## 00:21:10

**Ben Hayward:** It's the one I've just posted in the in the chat there, Rodrigo. So,
**Sharon Tuff:** Um,
**Ben Hayward:** it just says all architecture documented and handed over to Casat no lock in.
**Rodrigo Porto:** Oh, that's um we wanted to understand um how we can um have maintain our access uh what kind of are you do you use to to build the the SSO and and if we how do we manage to um continue working um after the World Cup.
**Sharon Tuff:** Sure,
**Rodrigo Porto:** Uh is it possible that we have that access um free access all the time and how how how does that work?
**Sharon Tuff:** that's clear. Um, do we want to give a an overview of that now?
**Ciaran Fisher:** Yes, it's a SAS it's a SASbased solution. So the the micro site is hosted by Cortex um configurable by by you. Um the SSO is also hosted by Cortex. So at the end of the tournament, you you've got options. We can turn it off and export the data all to you or we can continue based on the license fee.

## 00:22:20

**Ciaran Fisher:** But it's it's it's all managed and hosted by us. It's a SAS platform ultimately. Um, so there's nothing you need to do around around that too.
**Jack Carter:** and and basing based on what we were saying earlier it makes far more sense to to keep it going.
**Rodrigo Porto:** Perfect.
**Ciaran Fisher:** Yeah.
**Jack Carter:** Um,
**Rodrigo Porto:** And the license fee, right?
**Sharon Tuff:** Yeah, it's an annualized license fee and we typically trade in um you know increments three years,
**Rodrigo Porto:** Yeah.
**Jack Carter:** Jennings.
**Sharon Tuff:** five years. Um we can look at kind of year long terms. Um but I I think we'd be looking at trying to support you in building the business case to on board this functionality and deploy it across multiple major tournaments, multiple campaigns. You know, you can resin it for different sponsors. But I think this speaks to having this as the kind of bridge that sits between you, your stakeholders and your sponsor rather than actually giving it to your sponsor. We we link we tokenize and we uh enable that flow to be in you know to go to multiple multiple spaces.

## 00:23:18

**Sharon Tuff:** Um in ter
**Ben Hayward:** And we can we can show you that as well. We can show you the the kind of login dashboard. You can see all the different tools that you get access to. You have full control to to change things whenever you want to, however you want to. Um it's all presented there. Um so yeah, we can we can certainly show you that um both through some screenshots in the proposal and we can take you through it in a in a proper demo as
**Rodrigo Porto:** Yeah,
**Sharon Tuff:** Yeah.
**Rodrigo Porto:** I think that would be good.

**Sharon Tuff:** I think the other thing as well is the kind of 247 nature of what you are requiring and I think you spoke to that a little bit at the beginning of the call. You know, you don't your stakeholders don't want this to fall down. they just care about it being functional and working and not falling over with the level of demand. Was wondering what was really behind that. Is that just wanting they want access to someone 247?

## 00:24:06

**Sharon Tuff:** Um or are they really looking at that, you know, is is that a genuine kind of need
**Rodrigo Porto:** No. Yeah. Yeah.
**Sharon Tuff:** state?
**Rodrigo Porto:** I I don't think we'll need access to someone 24/7. I think we're uh as we're talking in in uh aiming at the World Cup, there are like 39 straight days with games nearly every day and we just we need to have access in in the key points there in those games. So basically um every tire a game that we can share with you um it's like the the most sensitive part of the the project u the the those five minutes before the game um before the the start of the TRA game because we're talking about millions and millions of people um we actually made a research here with our users and more than 70% um were um answered that they were going to
**Sharon Tuff:** Huh?
**Rodrigo Porto:** let um their final guesses of the prediction to the last 5 10 minutes of the game. So we are really So that said, we're aiming at at least 15 million users.

## 00:25:23

**Rodrigo Porto:** So maybe there will be a a really big spike there.
**Sharon Tuff:** Right.
**Rodrigo Porto:** Um so that that's the main concern. um at the beginning of each tire a game, we would would need really need to have um a really really fast SLAs in case something
**Jack Carter:** Yeah,
**Rodrigo Porto:** happens.
**Sharon Tuff:** Yeah.
**Jack Carter:** you can say and that that's largely about the people um that that Yeah, we

can look into that as well as part of the proposal of how we how we scub that
**Rodrigo Porto:** Yeah.
**Jack Carter:** out.
**Rodrigo Porto:** Okay.
**Sharon Tuff:** Cool. I think those are the key things from my side. Is it worth just leaving or do go with some of the elements of our SSO that you know are the unique features of what we do as a sports specific SSO and how that is very used to handling large top tier Premier League club kind of data with their global audiences that also kind of you know in the multiple millions and billions some would say if you listen to the Arsenals or the Liverpools of this world but um yeah do do you want to touch on

## 00:26:34

**Jack Carter:** Yeah, I mean a lot of them are the ones we touched on at the top.
**Sharon Tuff:** Um,
**Jack Carter:** So, a bit we talk a little bit about how we handle so we handle junior accounts separate from from adults accounts. uh so you can ensure that you know those those that are aged between 13 to to 18 or whichever age you've got as a cutoff have a relationship with uh with the guardian uh in terms of uh like just making sure they're separate profiles um which is a which is sort of a unique piece of cortex. Um we invest really heavily in security as I mentioned which is uh largely around like multiffactor authentication. So making sure it's robust for people to uh to log into the to the um the platform which really allows you to it comes at no extra cost as well. It's rolled out to all our customers. Um we kind don't want to price it to to a point that makes this a system less secure. Uh and then beyond that, we've got a lot a load of functionality around like bot detection.

## 00:27:28

**Jack Carter:** Um looking at password, potential password changes. So how we can um recommend when people's passwords aren't secure and we can recommend um stronger stronger passwords or an option to change passwords as well. Any other Oh,
**Sharon Tuff:** And I think maybe entitlements might um there might be a role for that here
**Jack Carter:** sorry.

**Sharon Tuff:** because I noted when you were looking at different tiers of users uh having access to different spaces based on premium you know subscribers versus normal registrations. Um, so we have something called entitlements which enables you to gate certain um, privileges, certain access rights to certain spaces and content uh, based on, you know, the the rights that they're granted. Um, so that might be something that we could also look at for you that might speak to you being able to have a different tiers of experience, different access to different um, leagues within the within the game and of course unlock more value based on points acrewed or things won. Um, so yeah, that's that's another kind of area of functionality that we can have a look at for you as well that might be interesting.

## 00:28:43

**Rodrigo Porto:** Yeah, I I don't know if that would be um already contained with live like I don't know. I'm just thinking out here.
**Sharon Tuff:** Okay.
**Rodrigo Porto:** Maybe it is, but we can explore it.
**Sharon Tuff:** Yeah. Okay. All right. Well, we can also check back on that. That's cool. Great. Anything else, Kieran? Anything else from you? Anything else from you, Ben?
**Ben Hayward:** Uh no just quickly add that kind of again alongside that suite of functionality the autoscaling part is very much the foundation of what we do with the so piece uh because we are sports specific ultimately everything we build is sport specific and right from day one we need to have that uh automatic scalability for peak periods around matches so that is absolutely fundamental to the product. Kieran, do you want to add a little bit more
**Ciaran Fisher:** Uh no no scaling points could be a good one.
**Rodrigo Porto:** Hey, if you can Oh,
**Ciaran Fisher:** Um sorry.
**Rodrigo Porto:** sorry.
**Ciaran Fisher:** Yeah. So so from scaling point of view we're used to this.

## 00:29:39

**Ciaran Fisher:** This is this is I mean six nations for example the traffic graph looks like a cliff um because there's nothing nothing fantasy opens and then every piles in six

nations then the thing drops off again. Um my only question was I don't think it was mentioned in the doc was languages um any particular languages you support as part of this is just one language you doing multilingual anything around
**Rodrigo Porto:** Yeah,
**Ciaran Fisher:** that only for fine
**Rodrigo Porto:** only Portuguese from Brazil. Yep. Okay. Um, if you can also send um examples of those speaks uh that you're used to work like in numbers so we can understand um a little bit more on your your biggest clients and what you're used to to work with.
**Ciaran Fisher:** Yeah, we do that.
**Jack Carter:** Yeah, I I think that rounds rounds off quite nicely to fair,
**Sharon Tuff:** Yeah.
**Jack Carter:** Rodrigo. That's what we'll um we'll put together in that proposal. So, we'll we'll we'll ensure that we've got a lot of these unique features that we mentioned just then, but but also some examples of live work.

## 00:30:39

**Jack Carter:** I I'll include a couple of um like apps that you can use to to see the experience itself. We'll uh we'll hone in on on a project timelines and then the commercials as well. Um which just leads me to confirm I read in that brief it's it's likely to be 15 million profiles. Is that the right ballpark number to go
**Rodrigo Porto:** Yeah,
**Jack Carter:** with?
**Rodrigo Porto:** that that's the what the least that's what the the least that we're we're
**Jack Carter:** Cool.
**Rodrigo Porto:** expecting.
**Jack Carter:** We we'll um yeah we'll put some some tears in so you can know how it would scale from from that aspect as well.
**Rodrigo Porto:** Just so you understand, um 2022 was the year Kazi was born and they had um rights of 20 games of the World Cup of 2022 and they they did like a really small prediction game with a bank app here in Brazil and they managed to break to break down the the app of the bank because of the number of concurrent users. um playing the the prediction game of the the bank a digital bank from Brazil and they had more than 8 million um concurrent there when that

## 00:31:48

**Sharon Tuff:** Wow.
**Rodrigo Porto:** happened. Um and the Kazep brand was 1% it is right now and now we have all the rights of the of all the 104 games
**Sharon Tuff:** Cool.
**Jack Carter:** Yeah.
**Rodrigo Porto:** versus only 20 games of the last World Cup. So that's why I say at least 15
**Jack Carter:** Wow. Yeah. um from my time in Brazil,
**Rodrigo Porto:** million.
**Jack Carter:** I I it's very apparent that football is quite a big sport over there.
**Sharon Tuff:** Yes.
**Jack Carter:** So, uh probably the biggest understatement. Um yeah, Rodrigo, thanks so much for your time. Um we we'll put all that stuff together uh and to get across by the end of the week to you. Um if you've got any questions or anything in the meantime, any bits that you're thinking, actually potentially I want to see this in the proposal, you've got uh emails, too. So, uh, so just send her the grass and we'll we'll get our heads to it and uh, yeah, be in
**Sharon Tuff:** Yeah,
**Rodrigo Porto:** That's
**Sharon Tuff:** and it would be good to put a regroup in once we've sent something over.
**Rodrigo Porto:** right.
**Sharon Tuff:** So,
**Jack Carter:** touch.
**Sharon Tuff:** Rodrigo, should we just have a look at calendars now given that you're up against such an ambitious time frame? Do you want to propose another catch up call? If we get something over to you by the end of the week, when can we regroup kind of next next week?
**Rodrigo Porto:** Um, we can Monday. Monday is okay for me. Um, well, you you're 4 hours ahead in London.
**Sharon Tuff:** Uh, what time are you there? Yeah,
**Jack Carter:** Yeah.
**Sharon Tuff:** I think we are.
**Rodrigo Porto:** 251 here.
**Jack Carter:** Yeah. We could do 5:00 p p.m.
**Sharon Tuff:** Yeah.
**Jack Carter:** UK time. So 1 p.m. your time on Monday. Does that sound good? Cool.

**Sharon Tuff:** Five.
